DHIS2 Training Courses:
Cutting-edge instruction

The DHIS2 information system is rapidly building a large user base in Africa, India and other developing regions. It is flexible and highly customizable, integrating a robust mobile phone surveillance module, clean data visualization tools and vast integration capabilities with reporting engines and other database applications.

Akros has been working with the DHIS2 development team at the University of Oslo and other stakeholders to assemble a course offering to meet the needs of DHIS2 end-users across the globe. These courses help users to understand the DHIS2 workflow, grasp the detailed technical aspects of working with the user interface, and visualize how a DHIS2 framework and server can be established for their own local needs.

DHIS2 Surveillance Training

The DHIS2 Surveillance Course is tailored to current or prospective DHIS2 end-users and primarily focuses on how to engage with the DHIS2 system to interact with data and create new content (e.g. charts, maps, reports, etc.) It serves equally well as an introduction to the system – very useful for those evaluating whether a DHIS2 implementation would benefit their country or program – and a training platform for those already working with a DHIS2 implementation.

DHIS2 M&E Tactics

The DHIS2 M&E Tactics course is tailored to monitoring and evaluation personnel currently using the DHIS2 application in their health system. The course takes a very hands-on approach to reinforce critical problem-solving skills required by M&E professionals. Using the framework of the DHIS2 information system, the course provides students a deep understanding of indicator development, responsive / evidence-based programming, impact assessment and overall data management.
